

# Sample I/O

SCT OFFICERS

October 18, 2020

The following are some I/O examples in various languages to get you started.

All programs read in a number  $N$  from the first line, proceed to read in  $N$  more numbers from the second line, and print their sum.

Sample input:

```
4
1 3 5 8
```

Sample output:

```
17
```

## 1 Java

Here I use a `BufferedReader` instead of a `Scanner`. It's much faster and much more reliable in the contest environment.

### 1.1 Standard I/O

```
1 import java.util.*;
2 import java.io.*;
3
4 class sum {
5     public static void main(String[] args) throws IOException {
6         BufferedReader f = new BufferedReader(new InputStreamReader(System.in));
7         int N = Integer.parseInt(f.readLine()); // read whole line
8         int[] num = new int[N];
9         StringTokenizer st = new StringTokenizer(f.readLine()); // split line by white space
10        for(int k = 0; k < N; ++k) {
11            num[k] = Integer.parseInt(st.nextToken());
12        }
13        int sum = 0;
14        for(int k = 0; k < N; ++k) {
15            sum += num[k];
16        }
17        System.out.println(sum);
18        System.exit(0);
19    }
20 }
```

## 1.2 File I/O

```
1 import java.util.*;
2 import java.io.*;
3
4 class sum {
5     public static void main(String[] args) throws IOException {
6         BufferedReader f = new BufferedReader(new FileReader("sum.in"));
7         PrintWriter out = new PrintWriter(new BufferedWriter(new FileWriter("sum.out")));
8         int N = Integer.parseInt(f.readLine()); // read whole line
9         int[] num = new int[N];
10        StringTokenizer st = new StringTokenizer(f.readLine()); // split line by white space
11        for(int k = 0; k < N; ++k) {
12            num[k] = Integer.parseInt(st.nextToken());
13        }
14        int sum = 0;
15        for(int k = 0; k < N; ++k) {
16            sum += num[k];
17        }
18        out.println(sum);
19        out.close(); // don't forget this!
20        System.exit(0);
21    }
22 }
```

## 2 C++

Here I will use C++-style I/O. If you prefer C-style I/O, that's fine too.

### 2.1 Standard I/O

The first two lines here are to speed up input. They are considered bad coding practice outside of the contest environment but are essential to get your times down if I/O is large. Note, however, that if you unlink with C-style I/O, you may not use `scanf()` and `printf()`, etc. Bad things will happen.

```
1 #include <iostream>
2 #include <fstream>
3
4 int num[100005];
5
6 int main() {
7     std::ios_base::sync_with_stdio(0); // unlink C-style I/O
8     std::cin.tie(0); // unlink std::cout
9     std::cin >> N;
10    for(int k = 0; k < N; ++k) {
11        std::cin >> num[k];
12    }
13    int sum = 0;
14    for(int k = 0; k < N; ++k) {
15        sum += num[k];
16    }
17    cout << sum << "\n";
18    return 0;
19 }
```

## 2.2 File I/O

```
1 #include <iostream>
2 #include <fstream>
3
4 int num[100005];
5
6 int main() {
7     std::ifstream fin("palpath.in");
8     std::ofstream fout("palpath.out");
9     fin >> N;
10    for(int k = 0; k < N; ++k) {
11        fin >> num[k];
12    }
13    int sum = 0;
14    for(int k = 0; k < N; ++k) {
15        sum += num[k];
16    }
17    fout << sum << "\n";
18    fin.close();
19    fout.close(); // don't forget this!
20    return 0;
21 }
```

## 3 Python

### 3.1 Standard I/O

```
1 n = int( input() ) # input() grabs the whole line
2 nums = input().strip() # removes extra spaces at beginning and end, also \n
3 nums = nums.split() # splits at the spaces to turn it into an array of strings
4 nums = [int(stng) for stng in nums] #turn them into ints
5 print( sum( nums ) )
```

### 3.2 File I/O

```
1 file = open('input.txt', 'r') # r for read
2 out = open('output.txt', 'w') # w for write
3
4 n = int(file.readline().strip()) # strip() isn't always necessary, but it's a good habit
5 nums = file.readline().strip()
6 nums = nums.split() # splits at the spaces to turn it into an array of strings
7 nums = [int(stng) for stng in nums] #turn them into ints
8 out.write( str( sum( nums ) ) + '\n' ) # str() and + are necessary because write() takes
   only a single string
9
10 file.close()
11 out.close()
```
